cell

A; Reference number: A60597; MUID:89121031 A; Accession: B60597

```
A Molecule type: mRNA
A; Residues: 596-799 (RYS>
A; Residues: 596-799 (RYS>
C; Comment: The receptor is a heterodimer of alpha and beta chains.
C; Comment: The receptor is a heterodimer of alpha and beta chains.
C; Superfamily: integrin beta chain; laminin-type EGF-like homology
C; Keywords: call adhesion; duplication; glycoprotein; heterodimer; receptor; transmembra
C; Keywords: call adhesion; duplication; glycoprotein; heterodimer; receptor; transmembra
F; 1-20, Domain: signal sequence #status predicted (ASI)
F; 21-739/Product: fibronectin receptor beta chain #status predicted (FXT)
F; 730-752, Domain: transmembrane #status predicted (FXT)
F; 730-752, Domain: intracellular #status predicted (FXT)
F; 750-794, 97, 212, 269, 363, 406, 417, 482, 521, 585, 670, Minding site: carbohydrate (Asn) (covalent)
A; Status: nucleic acid sequence not shown; not compared with conceptual translation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Subtilisin-like proprotein convertase (EC 3.4.21.-) 5 precursor - human (fragment) C; Species: Homo sapiens (man) C; Species: Homo sapiens (man) C; Species: Homo sapiens (man) C; Accession: G02428 E; Reudelhuber, T.L. AND PCSA/SHORT; ARE PRODUCED BY ATTERNATIVE SPLICING.

-1 TISSUE SPECIFICITY: PCSA IS EXPRESSED IN MOST TISSUES BUT IS MOST
ABUNDANT IN THE INTESTINE AND ADRENALS. PCSB IS EXPRESSED IN THE
INTESTINE, ADREBALS AND LOUG BUT NOT IN THE BRAIN.

-1 DEVELOPMENTAL STAGE: WEAKLY EXPRESSED THROUGHOUT THE BRBRYO.

-2 DEVELOPMENTAL STAGE: WEAKLY EXPRESSED THROUGHOUT THE BRBRYO.

-3 DEVELOPMENTAL STAGE: WEAKLY EXPRESSED THROUGHOUT THE BRBRYO.

-4 DEVELOPMENT BY PRESSION OBSERVED IN DIFFERENCIATED DECIDIA. AT
E6.5, PROMINENT EXPRESSION OBSERVED IN DIFFERENCIATED DECIDIA. AT
E7.5, INTENDES EXPRESSION OBSERVED IN DIFFERENCIATED BETWEEN
NASCENT MESCODERM. AT 8.5, ABUNDANT EXPRESSION IN SOMITES AND YOLK
SAC FOLLOWED BY A CONFINATION TO DERMAMYOTOME COMPARTMENT. BETWEEN
E9.5 AND E11.5, ABUNDANT EXPRESSION IN ARR (FILKEREDE DECIDERAL
CELLS OF LIMB BUDS). AT E12.5, EXPRESSION IN THE LIMBS IS CONFINED
TO THE CONDENSING MESENCHYM SURROUNDING THE CARTLIAGE. AT THIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rancourt S.L., Rancourt D.E.;
"Murine subtilisin-like proteinase SPC6 is expressed during embryonic implantation, somitogenesis, and skeletal formation.";

Dev. Genet. 21:75-81(1997)

-!- FUNCTION: LIKELY TO REPRESENT A WIDESPREAD ENDOPROTEASE ACTIVITY WITHIN THE CONSTITUTIVE AND REGULATED SECRETORY PATHWAY. CAPABLE OF CLEAVAGE AT THE RX(K/R)R CONSISSUS MOTIF. MAY BE RESPONSIBLE FOR THE MATURATION OF GASTROINTESTINAL PEPTIDES. MAY BE INVOLVED IN THE CELLGLAR PROLIFERATION OF ADRENAL CORPEX VIA THE ACTIVATION OF GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CATALYTIC ACTIVITY: RELEASE OF MATURE PROTEINS FROM THEIR PROPROTEINS BY CLEAVAGE OF ARG-YAA-YAA-RAC-1-ZAA BONDS, WHERE XAA CAN BE ANY AMINO ACID AND YAA IS ARG OR LYS.
SUBCELLULAR LOCATION: PCSA IS SCRETED THROUGH THE REGULATED SECRETORY PATHWAY. PCSB IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO A PARAUCLERR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH EARLY ENDOSOMES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ALTERNATIVE PRODUCTS: AT LEAST 2 ISOFORMS; PC5B/LONG (SHOWN HERE)

- 1- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN, EXCLUSIVELY ON THE APICAL REGION OF THE SPERM HEAD.
- 1- TISSUE SPECIFICITY: IN TESTIS; PRIMARILY IN HAPLOID SPERMATIDS.
- 1- DOMAIN: THE MAM DOMAINS PROBABLY MEDIATES SPERM ADHESION TO THE ZONA PELLUCIDA.
- 1- DOMAIN: DURING SPERM MIGRATION THROUGH THE REPRODUCTIVE TRACTS, THE MUCIN-LIKE DOMAIN MIGHT INHIBIT INAPPROPRIATE TRAPPING OF SPERMATOZOA ON PROMOTING ADHESION TO THE OVIDUCITAL ISTHMUS.
- 1- DOMAIN: THE VWFD DOMAIN 2 MAY MEDIATE COVALENT
- 1- DOMAIN: THE VWFD DOMAIN 2 MAY MEDIATE COVALENT
- 1- SIMILARITY: CONTAINS 3 MAM DOMAINS.
- 1- SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.

                                                                                    4;
                                                                                                                                                                                                                                                                                                                                                                                                MOTABLE AND CONTAINED TO THE MENT OF THE MOTABLE AND CONTAINED TO THE MOTABLE AND CONTAINED THE RECEPTOR. INTERLY TO BE A MULTIFUNCTIONAL ENDOCYTIC RECEPTOR, THAT MAY BE IMPLICATED IN THE UPTAKE OF LIPOPROTEINS AND OF PROTEASES. BINDS LDL, THE MADOR CHOLESSEROL-CERRYING LIPOPROTEIN OF PLASMA, AND TRANSPORTS IT INTO CELLS BY ENDOCYTOSIS. BINDS THE RECEPTOR-ASSOCIATED PROTEIN (RAP). COULD PLAY A ROLE IN CELL-CELL INTERACTION. BOTH ESTROGEN STATUS AND CHOLESTEROL LEVELS LACK REGULATORY EFFECTS ON THIS RECEPTOR.

1. SUBCELLULAR LOCATION: Type I membrane protein (Potential).

2. SUBCELLULAR LOCATION: Type I membrane protein (Potential).

2. SIMILARITY: CONTAINS 5 BNR REPEATS.

3. SIMILARITY: CONTAINS 1 EGF-LIKE DOMAINS.

4. SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

SUBBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE
DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMA), WHICH ARE BOUND
TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE
COMPRISING ONE LONG & THREE SHORT ARMS WITH GLIGBULES AT EACH END.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 targets of developing sensory axons.";

SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).
TISSUE SPECIFICITY: STRONGLY EXPRESSED IN PERIPHERAL NERVES,
TISSUE SPECIFICITY: STRONGLY EXPONA, AORTIC ENDOTHELIUM,
CARDILG MUSCLE, FAT, DERMIS, LUNG STROMA, AORTIC ENDOTHELIUM,
ENDOCARDIUM AND ENDOTHELIUM OF BLOOD VESSELS IN SKIN AND BRAIN.
DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT
WITH OTHER LAMININ CHAINS TO FORM A COILED COIL, STRUCTURE.
SUMMAIN: DOMAIN GI GLOBULAN
SIMILARITY: CONTAINS 3.5 LAMININ EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PROSITE; PS0002; EGF_1; UNKNOWN_1.

SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE
SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE
DIFFRENT POLYPEPETIDE CHALNS (ALPHA, BETA, GAMMA,), WHICH ARE BOUND
TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHARED MOLECULE
COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.
SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT
                                                                                                                                                                                                                                                "Localization of the gene (LAMA4) to chromosome 6q21 and isolation of a partial cDNA encoding a variant laminin A chain."; Genomics 22:237-239(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pfam; PF00054; laminin_c, ...

"Structure of rat procathepsin B: model for inhibition of cysteine protease activity by the proregion.";

Structure 4:406-416(1996).

C. '- FUNCTION: THIOL PROPESS WHICH IS BELIEVED TO PARTICIPATE IN INTRACELLULAR DEGRADATION AND TURNOVER OF PROTEINS. HAS ALSO BEEN IMPLICATED IN TUMOR INVASION AND METASTASIS.

C. CATALYTIC ACTIVITY: HYDROLYSES PROTEINS, WITH A SPECIFICITY RESEMBLING THAT OF PAPAIN.

C. SUBUNIT: DIMER OF A HEAVY CHAIN AND A LIGHT CHAIN CROSS-LINKED BY A DISCURLEDE BOND.

C. SUBCELLULAR LOCATION: LYSOSOMAL.

C. SUBCELLULAR LOCATION: LYSOSOMAL.

C. SUBLIBRITY: BELONGS TO PEPTIDASE FAMILY C1; ALSO KNOWN AS THE PAPAIN FAMILY OF THIOL PROTEASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS).
